Flexbox Properties

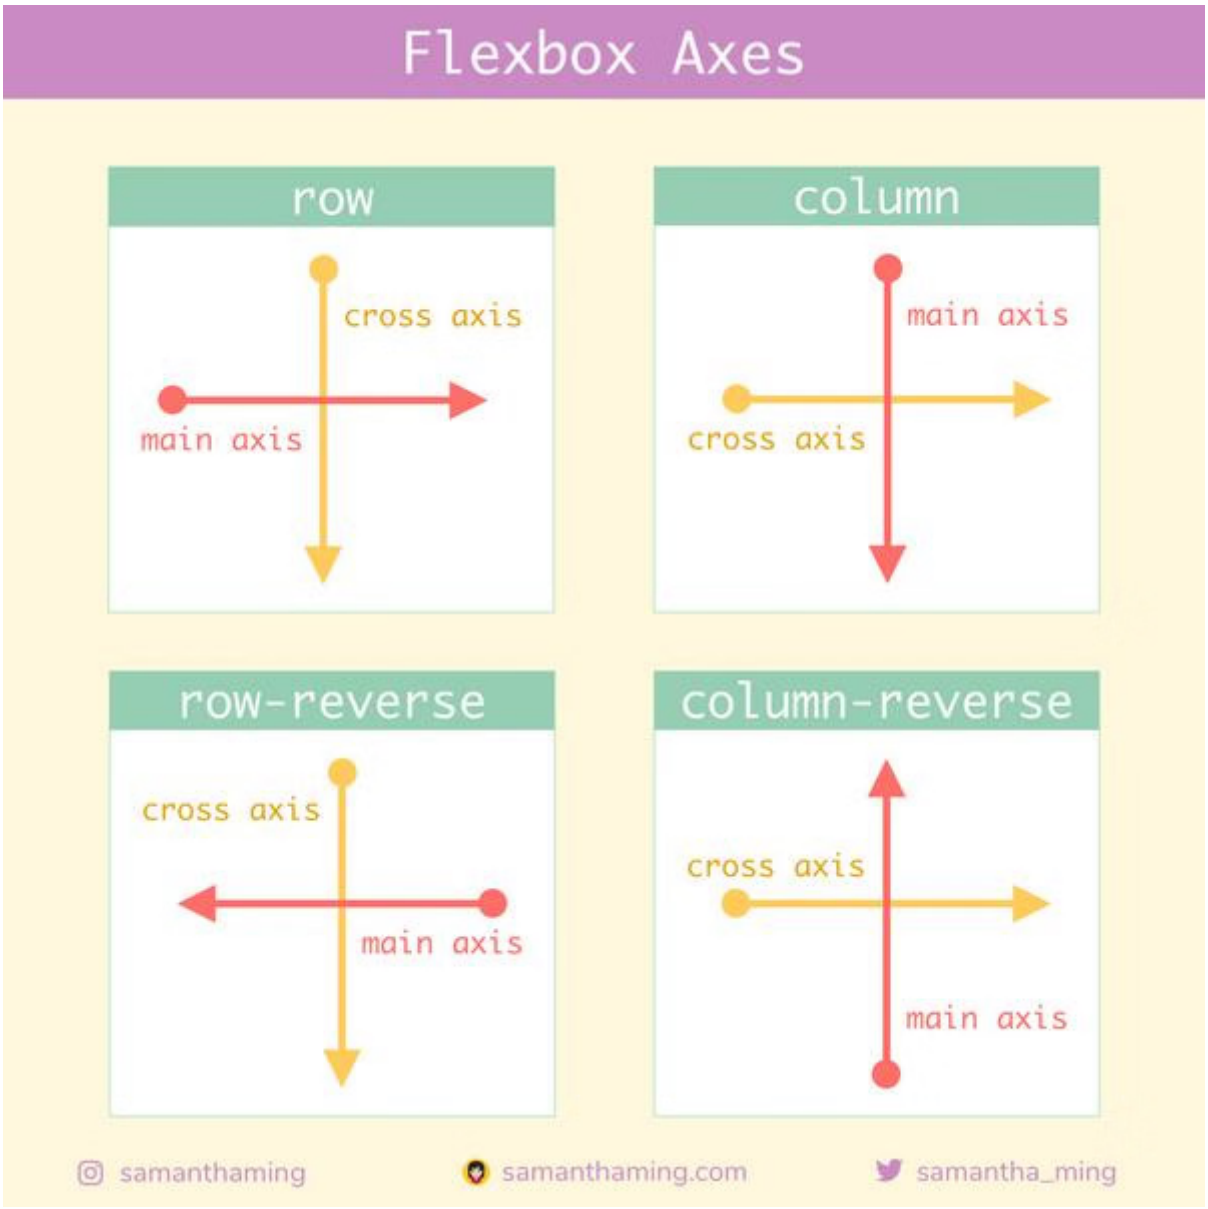

What if I forget?

> https://flexboxfroggy.com/ Great website to re-learn all these concepts again!

Justify-Content

Align the content along the main axis, the possible value can be:

1. flex-start (default
2. flex-end
3. center
4. space-between
5. space-around
6. space-evently

Align-Items

Align the content along the cross axis, the possible values are:

1. flex-start
2. flex-end
3. center
4. baseline
5. stretch (default)

Align-Content

> Don't confuse it with align-items, they do different things

Not to be confused with align-items, align-content sets how multiple lines of contents are spaced apart from each other. Align-Items on the other hand determines how the items as a whole are aligned within the container.

When there is only one line of content, then Align-Content has no effect.

The possible values are:

1. flex-start
2. flex-end
3. center
4. space-between
5. space-around
6. stretch (default)
