

Iterables

Iterables

A generalization of arrays, it allows us to make any object iterable in the context of `for ... of` loop.

Making an object iterable just requires you to add the `Symbol.iterator` hidden property which is a function that returns the iterator. Really doubt this is ever need to be done, but the option is there if it is needed. The code for it isn't that bad.

String is iterable

You can iterate over each letter of a String using `for ... of` loop since the String type probably have `Symbol.iterator` implemented.

```
for (let char of "Testing") {  
  console.log(char); // T, e, s, t, i, n, g  
}
```
