

Loops and switch statement

While and for loop

They are the same as in Python, C, and Java

```
while (condition) {  
    // Repeat certain code  
}  
  
for (begin; condition; step) {  
    // Repeat certain code  
}
```

`break` and `continue` both works the same way as in any other language.

Switch statement

```
switch(x) {  
    case 'value1':  
        // Do something if x is === 'value1'  
        break;  
    case 'value2':  
        // Do something if x is === 'value2'  
        break;  
    default:  
        // Do something if x isn't equal to any value above  
        break;  
}
```

The equality for the case is checked using strict equality (===).
